

ESTES PARK HEALTH

Wound Care Clinic

Many people suffer from chronic open sores that can become seriously infected. A variety of factors can influence a wound to become chronic and refuse to heal. If you have circulation problems, are a senior or diabetic, you're at a greater risk of non-healing wounds because of blood flow.

If you have any of the following symptoms, you may have an infection:

- Your wound feels hot, always painful or throbbing
- Your wound produces pus, drainage or a bad odor
- Your wound and the area surrounding are swollen
- Your wound and the area around the wound are red

See your physician if you have a wound that is infected, or a skin disorder that is not healing. Your physician can refer you to the Estes Park Health Wound Care Clinic. We offer a patient-focused, evidence-based and outcome-driven program designed to get your wound healed as quickly as possible. Wounds that resist healing can lead to serious complications. Chronic and non-healing wounds can be particularly challenging. Our expert staff helps wounds progress through the stages of healing using state-of-the-art tools to get you back to doing what you love to do.

Call the Outpatient Care Coordinator at 970-586-2200 for more information.
